

Fig. 1

Figure 1 consists of 12 line graphs arranged in a 6x2 grid. The left column contains graphs (a) through (f), and the right column contains graphs (g) through (l). Each graph plots a physiological parameter against time (0 to 10 minutes). The y-axis for all graphs ranges from 0 to 100. The x-axis for all graphs ranges from 0 to 10 minutes. The graphs show that HR, SV, CO, MAP, PVR, SVR, and PVR/SVR ratio all increase during the intervention period, while PVR (dynes/cm²) and SVR (dynes/cm²) remain relatively stable.
